Diffusion of Gases: The thermal motion of gas particles at above absolute zero temperature is called molecular diffusion. The rate of this phenomenon movement is a function of the viscosity of the gas, temperature, and size of the particles. The result of diffusion is a slow mixing of materials where the distribution of molecules or atoms are ...

Diffusion is a physical process that refers to the net movement of molecules from a region of high concentration to one of lower concentration. The material that diffuses could be a solid, liquid or gas. Similarly, the medium in which diffusion occurs could also be in one of the three physical states.

Diffusion is a fundamental factor in both natural and human-made processes. Being a universal physical phenomenon, we deal with it throughout our daily life. "Diffusion is the movement of particles from the area of higher concentration to lower concentration area, continuing until equilibrium is reached" .

Osmosis vs. diffusion is misleading as far as titles go. Both are kinds of passive transport. Passive transport is the gradual movement of molecules from one concentration to another until they are equalized, or at least that's the shortest definition. Osmosis and diffusion are two ways to accomplish this equilibrium.
