A proximity fuze is a fuze that detonates an explosive device automatically when the distance to the target becomes smaller than a predetermined value. Proximity fuzes are designed for targets such as planes, missiles, ships at sea, and ground forces. They provide a more sophisticated trigger mechanism than the common contact fuze or timed fuze. It is estimated that it increases the lethality by 5 to 10 times, compared to these other fuzes.

Proximity fuzes for these applications may function as radio or electro-optical altimeters or as slant-range-sensing devices that measure range to the surface at the projected point of weapon impact. One means of signal selection makes use of the radar principle, in which the elapsed time between a transmitted and received pulse is a function of range between target and weapon.
